Question in new chat

75%

The human body contains how much water?

The human body is made up of approximately **55% to 60%** water on average for adults. This percentage can vary based on age, sex, and body composition (for instance, newborns are about 75% to 78% water, which decreases during the first year of life).

Different organs and tissues contain vastly different proportions of water:

- **Lungs:** ~83%
- **Muscles and Kidneys:** ~79%
- **Brain and Heart:** ~73%
- **Skin:** ~64%
- **Bones:** ~31%

Want to know how the body regulates its water balance?

↪ Yes

How much water does the earth cover?

Approximately **71%** of the Earth's surface is covered by water, while the remaining **29%** consists of land (continents and islands).

The vast majority of this water is stored in the global oceans, with a breakdown of Earth's water distribution looking like this:

- **Oceans and Seas:** ~96.5% (saline water)
- **Ice Caps, Glaciers, and Permanent Snow:** ~1.74% (freshwater)
- **Groundwater and Soil Moisture:** ~1.69% (mostly fresh)
- **Lakes, Rivers, Atmosphere, and Living Organisms:** A tiny fraction of total water (~0.07%)

Want to know how much of Earth's water is actually drinkable freshwater?

↪ Yes

At what degrees water boils at sea level?

Water boils at **100°C** (which is **212°F**) at standard atmospheric pressure at sea level.

At this temperature, the vapor pressure of the water equals the surrounding atmospheric pressure, allowing it to transition rapidly from a liquid to a gas (steam). As you go higher in altitude (like on a mountain), the atmospheric pressure decreases, which means water boils at a lower temperature.

Want to know how altitude affects the boiling point of water?

↪ Yes
